Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

Linked or multi-mode networks are collections of networks over at least two sets of nodes (modes) and consist of some one-mode networks and some two-mode networks linking different modes.

For example: modes are Persons and Organizations. Two one-mode networks describe collaboration among Persons and among Organizations. The linking two-mode network describes membership of Persons to different Organizations.

Linked networks were introduced as a Meta-Matrix approach by Krackhardt and Carley in 1998 [5, 3].

Analysis of linked networks

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

We can analyze each network separately using available methods for analysis of one-mode and two-mode networks.

For analysis of linked networks we can also use the constrained blockmodeling approach (Žiberna [10]).

In this presentation we will discuss some issues related to the use of *derived networks* obtained by network multiplication.

Multiplication of networks

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

Given a pair of compatible networks $\mathcal{N}_A = ((\mathcal{I}, \mathcal{K}), \mathcal{A}_A, w_A)$ and $\mathcal{N}_B = ((\mathcal{K}, \mathcal{J}), \mathcal{A}_B, w_B)$ with corresponding matrices $\mathbf{A}_{\mathcal{I} \times \mathcal{K}}$ and $\mathbf{B}_{\mathcal{K} \times \mathcal{J}}$ we call a *product of networks* \mathcal{N}_A and \mathcal{N}_B a network $\mathcal{N}_C = ((\mathcal{I}, \mathcal{J}), \mathcal{A}_C, w_C)$, where $\mathcal{A}_C = \{(i, j) : i \in \mathcal{I}, j \in \mathcal{J}, c_{i,j} \neq 0\}$ and $w_C(i, j) = c_{i,j}$ for $(i, j) \in \mathcal{A}_C$. The product matrix $\mathbf{C} = [c_{i,j}]_{\mathcal{I} \times \mathcal{J}} = \mathbf{A} * \mathbf{B}$ is defined in the standard way

$$c_{i,j} = \sum_{k \in \mathcal{K}} \mathsf{a}_{i,k} \cdot \mathsf{b}_{k,j}$$

In the case when $\mathcal{I} = \mathcal{K} = \mathcal{J}$ we are dealing with ordinary one-mode networks (with square matrices).

V. Batagelj

Derived networks

Multiplication of networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

If all weights in networks \mathcal{N}_A and \mathcal{N}_B are equal to 1 the value of $c_{i,j}$ counts the number of ways we can go from $i \in \mathcal{I}$ to $j \in \mathcal{J}$ passing through \mathcal{K} : $c_{i,j} = |\mathcal{N}_A(i) \cap \mathcal{N}_B^-(j)|$.

V. Batagelj Deriv

Derived networks

Multiplication of networks

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

The standard matrix multiplication is too slow to be used for large networks. For sparse large networks we can multiply much faster considering only nonzero elements. In general the multiplication of large sparse networks is a 'dangerous' operation since the result can 'explode' – it is not sparse.

If for the sparse networks \mathcal{N}_A and \mathcal{N}_B there are in \mathcal{K} only few nodes with large degree and no one among them with large degree in both networks then also the resulting product network \mathcal{N}_C is sparse.

The multiplication transforms two linked networks on sets $\mathcal{I} \times \mathcal{K}$ and $\mathcal{K} \times \mathcal{J}$ into a network on the sets $\mathcal{I} \times \mathcal{J}$. Such networks are called *derived* networks. They are usually weighted.

Two-mode network analysis

by conversion to one-mode network - projections

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

Often we transform a two-mode network $\mathcal{N} = ((\mathcal{U}, \mathcal{V}), \mathcal{L}, w)$ into an ordinary (one-mode) network $\mathcal{N}_r = (\mathcal{U}, \mathcal{A}_r, w_r)$ or/and $\mathcal{N}_c = (\mathcal{V}, \mathcal{A}_c, w_c)$, where \mathcal{A}_r and w_r are determined by the matrix $\mathbf{W}_r = \mathbf{W}\mathbf{W}^T$.

The network \mathcal{N}_c is determined in a similar way by the matrix $\mathbf{W}_c = \mathbf{W}^T \mathbf{W}$.

The networks \mathcal{N}_r and \mathcal{N}_c are analyzed using standard methods.

Bibliographic networks

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

From a bibliography on selected topic we can construct some two-mode networks:

works imes authors (WA),

works \times keywords (**WK**);

works \times journals/publishers (**WJ**);

works \times classification (WC)

authors \times institutions (AI);

```
institutions \times countries (states) (IS);
```

and sometimes also the one-mode citation network

```
works \times works (Ci);
```

where works include papers, reports, books, patents etc.

Besides this we get also at least the partition of works by the publication year, and the vector of number of pages.

Other derived networks

Conclusions

References

Let **WA** be the works \times authors two-mode authorship network; $wa_{pi} = 1$ is describing the authorship of author *i* of work *p*.

$$orall p \in W: \sum_{i \in A} wa_{pi} = \mathsf{outdeg}_{W\!A}(p) = \ \# \ \mathsf{authors} \ \mathsf{of} \ \mathsf{work} \ p$$

Transposition $\mathcal{N}^{\mathcal{T}}$ or $t(\mathcal{N})$ is a network obtained from \mathcal{N} in which the node sets are interchanged and to all arcs their direction is reversed. **AW** = **WA**^{\mathcal{T}}, **KW** = **WK**^{\mathcal{T}}, ...

The first *co-authorship* network is defined as Co = AW * WA

$$co_{ij} = \sum_{p \in \mathcal{W}} wa_{pi} wa_{pj} = \sum_{p \in \mathcal{N}^-(i) \cap \mathcal{N}^-(j)} 1$$

 $co_{ij} =$ the number of works that authors *i* and *j* wrote together $co_{ii} =$ the total number of works that author *i* wrote It holds: $co_{ij} = co_{ji}$.

Problem - papers with many co-authors Cores of orders 20–47 in **Co**(SN5)

Conclusions

References

Let $x = [x_1, x_2, ..., x_n]$ and $y = [y_1, y_2, ..., y_m]$ be vectors. Their outer product $x \circ y$ is an $n \times m$ matrix defined as

$$x \circ y = [x_i \cdot y_j]_{n \times m}$$

Denoting $S_x = \sum_i x_i$ and $S_y = \sum_j y_j$ we get

$$S = \sum_{i,j} (x \circ y)_{ij} = \sum_i \sum_j x_i \cdot y_j = \sum_i x_i \cdot \sum_j y_j = S_x \cdot S_y$$

Therefore: $S_x = S_y = 1 \Rightarrow S = 1.$

It is easy to veryfy that the outer product decomposition holds

$$\mathsf{AK} = \mathsf{AW} * \mathsf{WK} = \sum_{w} \mathsf{WA}[w, \cdot] \circ \mathsf{WK}[w, \cdot], \qquad \mathsf{AW} = \mathsf{WA}^{\mathsf{T}}$$

Note that for networks with all weights equal to 1 we have

Conclusions

References

(Out) normalization $n(\mathcal{N})$ is a network obtained from \mathcal{N} in which the weight of each arc *a* is divided by the sum of weights of all arcs having the same initial node as the arc *a*. For binary networks

$$n(\mathbf{A}) = \operatorname{diag}(\frac{1}{\max(1, \operatorname{outdeg}(i))})_{i \in \mathcal{I}} * \mathbf{A}$$

To get an equal contribution S = 1 of each work to the co-autorship network we have to use normalized vectors in the outer product decomposition. This is equivalent to define a normalized autorship network $\mathbf{N} = n(\mathbf{WA}) - fractional$ approach [2, 4, 8, 6, 9].

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

In 2001 Newman [7] proposed another fractional approach to defining a co-authorship network considered as a proxy for collaboration network. It is based on slightly different normalization

$$n'(\mathbf{A}) = \mathsf{diag}(rac{1}{\mathsf{max}(1,\mathsf{outdeg}(i)-1)})_{i\in\mathcal{I}}*\mathbf{A}$$

The fourth or *Newman's co-authorship network* is defined as

$$\mathbf{C}\mathbf{t}' = \mathbf{N}^T * \mathbf{N}'$$
, where $\mathbf{N}' = n'(\mathbf{W}\mathbf{A})$.

 ct'_{ij} = the total contribution of 'strict collaboration' of authors i and j to works.

The final result is returned as an undirected simple network without loops and with weights

$$ct'_{ij} = \sum_{p} \frac{2 \cdot wa_{pi} \cdot wa_{pj}}{\max(1, \text{outdeg}_{WA}(p)) \cdot \max(1, \text{outdeg}_{WA}(p) - 1)}$$

In WoS2Pajek the citation relation means p Ci $q \equiv$ work p cites work q.

(日) (同) (三) (三)

Therefore the *bibliographic coupling* (Kessler, 1963) network **biCo** can be determined as

$$\mathsf{biCo} = \mathsf{Ci} * \mathsf{Ci}^{\mathcal{T}}$$

 $bico_{pq} = \#$ of works cited by both works p and $q = |Ci(p) \cap Ci(q)|$. Bibliographic coupling weights are symmetric: $bico_{pq} = bico_{qp}$:

$$\mathbf{biCo}^{\mathsf{T}} = (\mathbf{Ci} * \mathbf{Ci}^{\mathsf{T}})^{\mathsf{T}} = \mathbf{Ci} * \mathbf{Ci}^{\mathsf{T}} = \mathbf{biCo}$$

V. Batagelj Derived networks

fractional approach

Derived networks

V. Batagelj

Linked networks

Multiplication

Co-authorship networks

Fractional approach

Other derived networks

Conclusions

References

Again we have problems with works with many citations, especially with review papers. To neutralize their impact we can introduce normalized measures. Let's first look at

$$biC = n(Ci) * Ci^{T}$$

where
$$n(Ci) = D * Ci$$
 and $D = diag(\frac{1}{\max(1, outdeg(p))})$. $D^T = D$

$$biC = (D * Ci) * Ci^T = D * biCo$$

$$\mathbf{biC}^{\mathsf{T}} = (\mathbf{D} \ast \mathbf{biCo})^{\mathsf{T}} = \mathbf{biCo}^{\mathsf{T}} \ast \mathbf{D}^{\mathsf{T}} = \mathbf{biCo} \ast \mathbf{D}$$

For $\mathbf{Ci}(p) \neq \emptyset$ and $\mathbf{Ci}(q) \neq \emptyset$ it holds (proportions)

 $\mathbf{biC}_{pq} = \frac{|\mathbf{Ci}(p) \cap \mathbf{Ci}(q)|}{|\mathbf{Ci}(p)|} \quad \text{and} \quad \mathbf{biC}_{qp} = \frac{|\mathbf{Ci}(p) \cap \mathbf{Ci}(q)|}{|\mathbf{Ci}(q)|} = \mathbf{biC}_{pq}^{T}$

and $\mathbf{biC}_{pq} \in [0, 1]$.

- Network multiplication enables us to link by derived networks some directly unlinked modes in a multimode network.
- The analysis of the obtained networks can be based on their weights using cuts, (generalized) cores, islands, etc.
- It is important to understand the meaning of the weights. Weights appropriate for our research question can be often obtained by an appropriate normalization.
